AMENDMENTS TO THE CLAIMS:

This listing of claims will replace all prior versions and listings of claims in the application:

Listing of Claims:

Claims 1-4 (canceled)

Claim 5 (currently amended) An air vent for ventilation installations in vehicles comprising a housing which defines an air outlet channel, and a manual operating element formed by a partial sphere to adjust direction and flow rate of air delivered by the vent said operating element being mounted in the housing to be rotatable about two axes perpendicular to each other the air vent according to any of the preceding elaims, wherein the control member operating element is mounted in the housing by means of a cross-shaped journal structure.

Claim 6 (currently amended) The air vent according to claim 5, wherein a first crossbeam of the journal structure has outer ends rotatably mounted in the housing and the control member operating element is rotatably mounted on the outer ends of the second crossbeam of the journal structure.

Claim 7 (currently amended) The air vent according to any of claims 1 to 4 claim 5, wherein the control member operating element is hollowed out in a dish shape.

Claim 8 (currently amended). The air vent according to elaims 6 and claim 7, wherein the dish-shaped control member operating element has formed-on bearing arms and the bearing arms have free ends that embrace the outer ends of the second crossbeam.

"Claim 9 (new) An air vent for ventilation installations in vehicles comprising a housing which defines an air outlet channel and a manual operating element, said operating element being formed by a partial sphere, said partial sphere being mounted in said housing to be rotatable about a first axis and about a second axis and said first and second axes being perpendicular to each other, said air vent further comprising a first set of blades being pivotally mounted in said air outlet channel for adjusting direction of air delivered by said air vent and being coupled with each other for joint motion, a second set of blades being pivotally mounted in said air outlet channel for adjusting direction of air delivered by said air vent and being coupled with each other for joint motion, and a flap being pivotally mounted in said air outlet channel between an open position and a closure position to adjust the flow rate of air delivered by said air vent, a rotation of said partial sphere about said first axis pivoting said first set of blades and a rotation of said partial sphere` about said second axis pivoting both said second set of blades and said flap.

Claim 10 (new) The air vent according to claim 9, further comprising an actuating arm connected with said operating element and adapted to pivot about said first axis and a coupling link connecting said first set of blades with said actuating arm.

Claim 11 (new) The air vent according to claim 10, further comprising a cam disk mounted in said housing to rotate about said second axis, said cam disk being coupled with said operating element for joint rotation and with said second set of bladies.

Claim 12 (new) The air vent according to claim 11, further comprising a control flap being pivotally mounted in said air outlet channel and being coupled to a pivotal lever mounted in said housing, said pivotal lever being coupled to said cam disk.
